The photos of the air filter are for representation purposes only. Actual air filter may look slightly different from the photos shown.

### TOOLS REQUIRED

- Tape Measure/Ruler
- 1/4" Nut Driver or Socket
- Drill
- 3/32" or 1/8" Drill Bit
- Pencil or marker
1. Turn off the electrical circuit breaker that serves the water heater.
2. Locate the air filters, brackets, and screws supplied with the kit and use (1) filter, (2) brackets, and (2) screws. See Figure 1.
3. Locate the air intake panel on the left side of the water heater. See Figure 2. Measure approximately 1” down from the center of the bottom of the panel opening and mark with a pencil or marker. Drill a 3/32” pilot hole in this mark. See Figure 3.
4. Attach one of the brackets with one of the screws in this pilot hole location. Do not fully tighten the screw and bracket. See Figure 4.
5. Position the air filter in the bottom bracket centering it across the air intake panel openings as shown in Figure 5.
6. Position another bracket on the top of the air filter centering as shown in Figure 6.
7. Mark the pilot hole location with a pencil or marker and remove bracket. Drill pilot hole with a 3/32" dill bit.
8. Reposition the top bracket and align the hole in bracket with the pilot hole. Install a screw through the bracket and pilot hole. Tighten top and bottom bracket screws.

9. Locate and install the other air filter and mounting brackets following steps 2-8 above to install the air filter on the right side air intake panel.
10. Turn on the electrical circuit breaker that serves the water heater.
11. Air filters should be visually inspected once every 3 months. Clean if needed. See the Cleaning the Air Filters section.
CLEANING THE AIR FILTERS

Important: Before attempting to clean or replace the air filter(s) turn off the electrical circuit breaker that serves the water heater.

1. Locate the air filter(s) and remove them from the water heater. They can be removed and cleaned one at a time. Loosen the mounting brackets and slide air filter out. The mounting brackets do not need to be removed.

2. To clean the air filters, use a vacuum with a hose attachment to remove any dust or debris. For heavier residues such as oil and grease the filters may be washed with warm soapy water. Rinse the soap and residue from the filters. Allow filters to dry before re-installing.

3. Re-install the air filters by sliding them back into the mounting brackets and retighten the mounting screws. Be sure to align and center the air filter with the openings in the air intake panel.

4. Turn on the electrical circuit breaker that serves the water heater.
